

Eyelash Extension Aftercare

- Wait at least 24 hours before getting your lashes wet after application.
- Avoid touching your lashes. Your fingertips leave behind dirt and oils which break down the bond of the glue.
- Do not try to perm your extensions or use eyelash curlers of any kind, as this will cause breakage to your extensions.
- Avoid heat, steam, and using oil based products on or around the eyes; when washing your face, wash eyes separately.
- Use mascara wands to brush extensions as needed, keeping them separated as much as possible. As they become tangled they may begin to shed.

- Use a dampened fingertip or q-tip with a non-oil based cleanser to gently remove makeup, sweat, and natural oils.
- Cleanse the eyelid/lash line area with toner or witch hazel since the skin/eyelids naturally create oils.
- You may use a blow dryer or fan after showering or swimming. This technique is known to prolong the life of your extensions as well as giving them a lifted look.

Maintaining Your Eyelash Extensions

The average person has 90-120 lashes per eye, shedding 2-6 lashes per day. This is why extensions cannot be permanent and require fills every 2-3 weeks.

Lash retention can vary by season.

We all have unique “shedding phases”. This is the time when the majority of your lashes are either growing or shedding. Shedding phase is unavoidable and should only last 2-4 weeks.

At the time of your “fill” appointment, 50% of your lash extensions should still be intact. If you have lost more than half of

your extensions, you will need to book an extended fill.

If you feel like you are losing more than 50% in between fills, this may be caused by premature shedding due to friction caused by sleep, exercise, excessive eye rubbing, allergies, etc.

Extend The Life And Length Of Your Natural Lash With RevitaLash!

New research shows using an eyelash growth serum not only conditions the natural state of your lashes, but by growing them can enhance the appearance of your extensions!
